

Microbe Hunter ?

Or Weakest Link?

By Bob Noiva, University of
South Dakota School of
Medicine

Many bacteria use this as a "grappling hook" to attach to the cells of the intestinal wall.

- a. Virulence factor
- b. Pilus
- c. Flagella
- d. Plasmid

Many bacteria use this as a "grappling hook" to attach to the cells of the intestinal wall.

- a. Virulence factor
- b. **Pilus**
- c. Flagella
- d. Plasmid

This cytoskeleton protein
polymerizes to form the pedestal
in *E. coli* infection.

- a. Actin
- b. Tubulin
- c. Clathrin
- d. Motrin

This cytoskeleton protein
polymerizes to form the pedestal
in *E. coli* infection.

- a. Actin
- b. Tubulin
- c. Clathrin
- d. Motrin

Which of the following is the least effective method of battling pathogenic bacteria?

- a. Use antibiotics
- b. Block the production of virulence factors
- c. Gram staining
- d. Vaccinate

Which of the following is the least effective method of battling pathogenic bacteria?

- a. Use antibiotics
- b. Block the production of virulence factors
- c. **Gram staining**
- d. Vaccinate

Which protein is used by *Listeria* to move around the infected cell?

- a. Actin
- b. Tubulin
- c. Flagellum
- d. Desmin

Which protein is used by *Listeria* to move around the infected cell?

- a. Actin
- b. Tubulin
- c. Flagellum
- d. Desmin

What is the major difference between a benign laboratory strain and a dangerous pathogenic strain of bacterium?

- a. Antibiotic resistance
- b. Virulence factors
- c. Mutation rate of the bacterial genome
- d. A pilus

What is the major difference between a benign laboratory strain and a dangerous pathogenic strain of bacterium?

- a. Antibiotic resistance
- b. **Virulence factors**
- c. Mutation rate of the bacterial genome
- d. A pilus

Which of the following is a consequence of a virus's DNA polymerase not having proofreading activity?

- a. Mutations do not occur
- b. Fewer mutations will occur
- c. More mutations will occur
- d. Viruses do not have DNA polymerase

Which of the following is a consequence of a virus's RNA polymerase not having proofreading activity?

- a. Mutations do not occur
- b. Fewer mutations will occur
- c. **More mutations will occur**
- d. Viruses do not have RNA polymerase

An unusual characteristic of the influenza genome is

- a. It contains 8 RNA segments encoding 8 proteins
- b. It is composed of both RNA and DNA
- c. It never mutates
- d. It is capable of self-replication

An unusual characteristic of the influenza genome is

- a. It contains 8 RNA segments encoding 8 proteins
- b. It is composed of both RNA and DNA
- c. It never mutates
- d. It is capable of self-replication

The genetic exchange that occurs in influenza transmission is

- a. fleas to mice to human
- b. pine nuts to deer mice to humans
- c. birds to humans
- d. birds to pigs to humans

The genetic exchange that occurs in influenza transmission is

- a. fleas to mice to human
- b. pine nuts to deer mice to humans
- c. birds to humans
- d. birds to pigs to humans

Europeans explorers decimated the native Americans in North and South America through the transmission of

- a. Tuberculosis
- b. Plague
- c. Smallpox
- d. Influenza

Europeans explorers decimated the native Americans in North and South America through the transmission of

- a. Tuberculosis
- b. Plague
- c. Smallpox
- d. Influenza

What pathogen caused the pandemic of 1918 that killed more people than World War I did?

- a. Tuberculosis
- b. Smallpox
- c. Hantavirus
- d. Influenza

What pathogen caused the pandemic of 1918 that killed more people than World War I did?

- a. Tuberculosis
- b. Smallpox
- c. Hantavirus
- d. Influenza

Pandemics arise because of

- a. Antigenic drift
- b. Antigenic shift
- c. Cross-immunity
- d. Limited cross-immunity

Pandemics arise because of

- a. Antigenic drift
- b. **Antigenic shift**
- c. Cross-immunity
- d. Limited cross-immunity

Some viruses have an additional coat composed of lipids and proteins called a

- a. Hemagglutinin
- b. Pilus
- c. Buffy coat
- d. Envelope

Some viruses have an additional coat composed of lipids and proteins called a

- a. Hemagglutinin
- b. Pilus
- c. Buffy coat
- d. Envelope

Which of the following is NOT a probable consequence of a virus infecting a host cell

- a. The virus particle disassembles and releases its genome
- b. The viral genome is replicated
- c. A new viral coat is assembled around the genome
- d. Host DNA is mutated by viral DNA

Which of the following is NOT a probable consequence of a virus infecting a host cell

- a. The virus particle disassembles and releases its genome
- b. The viral genome is replicated
- c. A new viral coat is assembled around the genome
- d. Host DNA is mutated by viral DNA

Which of the following pathogens
can cause stomach ulcers?

- a. Escherichia coli
- b. Mycobacterium tuberculosis
- c. Helicobacter pylori
- d. Varicella

Which of the following pathogens can cause stomach ulcers?

- a. Escherichia coli
- b. Mycobacterium tuberculosis
- c. Helicobacter pylori
- d. Varicella

Bacteria achieve superbug status when

- a. They become resistant to all antibiotics
- b. They cannot be killed by vaccines
- c. They conjugate with non-drug resistant bacteria
- d. They are infected with viruses

Bacteria achieve superbug status when

- a. They become resistant to all antibiotics
- b. They cannot be killed by vaccines
- c. They conjugate with non-drug resistant bacteria
- d. They are infected with viruses

Bacteria that have been crippled
to cause the loss of their
pathogenicity for use in vaccines
are called

- a. drug resistant
- b. immunoresistant
- c. attenuated
- d. transformed

Bacteria that have been crippled
to cause the loss of their
pathogenicity for use in vaccines
are called

- a. drug resistant
- b. immunoresistant
- c. attenuated
- d. transformed

Which of the following is NOT a mechanism for bacteria to transfer antibiotic resistance?

- a. mutation
- b. conjugation
- c. transduction
- d. transformation

Which of the following is NOT a mechanism for bacteria to transfer antibiotic resistance?

- a. mutation
- b. conjugation
- c. transduction
- d. transformation

Which of the following reasons does NOT explain why increasing numbers of pathogenic bacteria are becoming resistant?

- a. Viral genomic mutations
- b. Physician misuse of antibiotics
- c. Patient misuse of antibiotics
- d. Agricultural misuse of antibiotics

Which of the following reasons does NOT explain why increasing numbers of pathogenic bacteria are becoming resistant?

- a. viral genomic mutations
- b. physician misuse of antibiotics
- c. patient misuse of antibiotics
- d. agricultural misuse of antibiotics

Penicillin kills bacteria by

- a. inhibiting bacterial DNA synthesis
- b. inhibiting bacterial RNA synthesis
- c. inhibiting bacterial conjugation
- d. inhibiting bacterial cell wall synthesis

Penicillin kills bacteria by

- a. inhibiting bacterial DNA synthesis
- b. inhibiting bacterial RNA synthesis
- c. inhibiting bacterial conjugation
- d. **inhibiting bacterial cell wall synthesis**

Attempts at developing a vaccine for gonorrhoea have been unsuccessful because of

- a. antigenic variation in the pathogen
- b. drug resistant gonorrhoea
- c. overuse of penicillin by physicians
- d. increased use of condoms

Attempts at developing a vaccine for gonorrhea have been unsuccessful because of

- a. antigenic variation in the pathogen
- b. drug resistant gonorrhea
- c. overuse of penicillin by physicians
- d. increased use of condoms

A new area of science that combines biology and computer science to study the genome is called

- a. Bioinformatics
- b. Forensics
- c. Mnemonics
- d. Antibiotics

A new area of science which combines biology and computer science to study the genome is called

- a. **Bioinformatics**
- b. Forensics
- c. Mnemonics
- d. Antibiotics
